1 Introduction

All of these commands can be modified or added to by editing “config/latex.toml” or using the voice command “configure latex”.

2 Bibliography management

Once you have added the location of your .bib file (using regular slashes) to your LaTeX config file, Mathfly includes a number of commands to make bibliography management easy:

Insert my (bib resource — bibliography)	<code>\addbibresource{your_bibliography.bib}</code>
Add paper to bibliography	Searches google scholar for the highlighted text (paper title), appends the first resulting bib-Tex citation to your bibliography file and adds the tag to the clipboard, ready to be pasted into a document.
Add book to bibliography	Same as above, but searches goodreads instead.
Add link to bibliography	Same as above, but constructs a citation from a url instead.
(edit — open) bibliography	Opens your .bib file in your text editor, for manual alterations and searching.

3 Document classes

Prefixed by "document class", these commands produce for example:

```

8 Mathematics

8.1 Symbols

In normal L^AT_EX mode, these must all be prefixed with “symbol”. if you are dictating a large block of mathematics, then use “enable latex maths” to remove the need for prefixes before numbers and symbols, so that you can dictate more naturally.

9 Templates

Templates provide a way to insert larger sections of text into your documents, for example you may have a particular set of packages which you always want to import at the head of your files, or a particular diagram which you need to draw over and over again. They are defined in the templates section of `config/latex.toml` and by default are executed using the “`template template_name`” command. A couple are included as standard for illustrative purposes but these are designed to be edited to suit your needs. For example, the command “`template wrap figure`” will insert:

```
\begin{wrapfigure}{l}{0.5\textwidth}  
\centering  
\label{}  
\includegraphics[width=0.4\textwidth]{}  
\caption{}  
\end{wrapfigure}
```
